RETAINING WALL SYSTEMS
Rebuild Right™. Choose from our proven range of modular concrete retaining wall solutions available for DIY residential jobs through to highly engineered civil structures. The appropriate wall for your situation will depend on a number of things, a critical criteria being the height of the wall. This document provides solutions in three height categories:

<table>
<thead>
<tr>
<th>Height Category</th>
<th>Solutions</th>
</tr>
</thead>
<tbody>
<tr>
<td>1M HIGH RETAINING WALLS</td>
<td>2.5M MEDIUM RETAINING WALLS</td>
</tr>
</tbody>
</table>

For the residential market, modular concrete retaining wall systems such as the Keystone® range and masonry blocks offer many advantages including:

- Long life - concrete products are renowned for their durability, they will not rot or rust
- Low maintenance
- Attractive finish – choose from a variety of colours and textures
- You can create vertical uninterrupted walls
- Ease of construction
- Standard designs

The following steps will lead you to answers determining the height of your retaining wall, whether you require a building consent before you proceed, if you can build a retaining wall yourself, or whether you need to call in an engineer and qualified builder.
## WILL I NEED A BUILDING CONSENT?

### NO

- If the height of the retained soil is less than 1.5m high (measure or calculate the difference in elevation from the top of the soil behind the wall and in front of the wall. It needs to be always less than 1.5m), and
- If there will be no vehicles coming within 1.5m of the top of the retaining wall, and
- If there are no foundations within 1.5m of the top of the retaining wall, and
- If the ground behind and in front of the wall is horizontal
- The wall needs to be built on and supporting competent soils. By this we mean, if difficult soil conditions are encountered (expansive soils, peats, uncontrolled fill, weak/soft materials) engineering advice should be sought.

**NOTE:** Your local district plan should be consulted. For example, the Auckland District plan defines any retaining wall that exceeds 1.0m in height is regarded as a building. Therefore all requirements under the district plan relating to a building apply to a retaining wall that exceeds 1.0m in height. This may mean that resource consent is required even if a building consent is not. A resource consent will also be required if the extent of the excavation exceed specified limits. If you are unsure, always ask your local Council for guidance.

### YES

- If the height of the retained soil is more than 1.5m high (measure or calculate the difference in elevation from the top of the soil behind the wall and in front of the wall), or
- If there will be vehicles coming within 1.5m of the top of the retaining wall, or
- If there are foundations within 1.5m of the top of the retaining wall, or
- If the ground behind and in front of the wall is sloping
- The wall needs to be built on and supporting competent soils. By this we mean, if difficult soil conditions are encountered (expansive soils, peats, uncontrolled fill, weak/soft materials) engineering advice should be sought.

**CAN I BUILD THE RETAINING WALL MYSELF?**

Small walls not requiring a building consent can be constructed by the home owner but will need to be built fully in accordance with the manufacturer’s instructions. Be aware that many of the components of a retaining wall are heavy and therefore a high degree of fitness will be required.

**DOES THIS MEAN I CAN BUILD WHATEVER I LIKE?**

Although a building consent may not be required, any building work conducted must comply with the Building Code. The wall must be durable and structurally sound. The best way of ensuring this is to use standard solutions provided by manufacturer’s such as Firth.

### MEDIUM RETAINING WALL GUIDE

<table>
<thead>
<tr>
<th>THESE SOLUTIONS WILL REQUIRE SPECIFIC ENGINEERING DESIGN</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>KEYSTONE® COMPAC IV WITH GEOGRIDS</strong></td>
</tr>
<tr>
<td>Description: Compac IV split face facing with geogrids maximum every 3rd course. Geogrid length typically height of wall. Walls can be constructed near vertical or two battered setback options of 8.8° and 4.4°. Can be built higher.</td>
</tr>
<tr>
<td>Access Requirements: Require access for excavation and compaction equipment. Compac IV elements arrive on a pallet but can be manhandled into place.</td>
</tr>
<tr>
<td>Weight of Unit (Approximate): 34 - 36.6kg</td>
</tr>
<tr>
<td>Excavation Required: The length of the geogrids are typically similar to the height of the wall. The width of the excavation is therefore typically the height of the wall plus what ever distance is required to ensure stability of the exposed excavated face.</td>
</tr>
</tbody>
</table>

| **KEYSTONE® COMPAC IV WITH NO FINES CONCRETE BACKFILL** |
| Description: Compac IV split face facing with Manta Ray or similar earth anchors. Walls can be constructed near vertical or two battered setback options of 8.8° and 4.4°. Can be built higher. |
| Access Requirements: Require access for excavation equipment. The non fines concrete backfill needs straight discharge from the truck or barrowed into position. |
| Weight of Unit (Approximate): 34 - 36.6kg |
| Excavation Required: The width of the no fines concrete backfill is typically half the height of the wall. Therefore this solution can be used in more confined situations. |

| **KEYSTONE® COMPAC IV WITH SOIL ANCHORS** |
| Description: Compac IV split face facing with Manta Ray or similar earth anchors. Walls can be constructed near vertical or two battered setback options of 8.8° and 4.4°. Can be built higher. |
| Access Requirements: Require access for excavation equipment and light drilling equipment for earth anchoring system. |
| Weight of Unit (Approximate): 34 - 36.6kg |
| Excavation Required: This solution is ideally suited for situations where the soil slope is naturally stable. This means that the excavation can be a little as 600mm wide to accommodate the heads of the earth anchors, gravel backfill and the Compac IV facing. |

| **FIRTH MASONRY** |
| Description: Masonry retaining walls comprise of a concrete footing and a reinforced concrete masonry wall. Drainage gravel is provided behind the wall. For fast and easy erection the Firth mortartless masonry system (EsiBloc™) can be used. For walls between 1 and 2.5m high, a 190mm wide block is required. Colour and texture of blocks can be provided by special order. |
| Access Requirements: Require access for excavation and compaction equipment. Masonry blocks arrive on a pallet but can be manhandled into place. Will need access for concrete truck and pump to place concrete and fill blocks. |
| Weight of Unit (Approximate): 190mm wide block - [2016] 16kg |
| Excavation Required: With the footing extending in front of the wall the excavation depth is typically the wall thickness (300mm) plus the width of drainage materials (300mm). Then what ever distance is required to ensure stability of the exposed excavated face. When the footing extends to the rear of the wall, the excavation required is increased by the footing width. |
| Reference Material: Visit www.firth.co.nz for: Firth Masonry Retaining Walls, EsiBloc Mortarless Masonry Brochure |

| **KEYSTONE® KEYSTEEL® WITH STEEL LADDERS** |
| Description: Keystone® KeySteel split face facing with galvanized steel ladder soil reinforcement. Split face texture to one side in either Tri-Face/Bevelled or Straight-Face. Seismic resilient low extension system. Can be built near vertical with either fibre glass or steel pins. Can be built higher using steel ladders. |
| Access Requirements: Require access for excavation, and compaction equipment, and access to allow delivery of the units. |
| Weight of Unit (Approximate): 42kg |
| Excavation Required: The length of the steel ladders are typically similar to the height of the wall. The width of the excavation, if required, is typically the wall thickness plus whatever distance is required to ensure stability of the exposed excavated face. |
| Reference Material: Visit www.firth.co.nz for: Keystone® KeySteel Brochure |

| **HUMES ANCHORBLOC™** |
| Description: The blocks are 1.2m wide and 1m high. The hollow centre reduces the weight of the unit. The void being gavel filled after erection. The system is available in half height units and corner units. The face can be modified to achieve various decorative finishes, the most common being an exposed aggregate finish. The units are designed to accommodate geogrid. |
| Access Requirements: Require access for excavation, and compaction equipment, and access to allow delivery of the units. |
| Weight of Unit (Approximate): The 1.5 tonne blocks can be lifted by standard excavation equipment. |
| Excavation Required: The depth of the units is 900mm, so excavation is required to accommodate the units, drainage pipes, the length of any geogrid (when required) and what ever distance is required to ensure stability of the exposed excavated face. |
| Reference Material: Visit www.humes.co.nz for: Humes Concrete Retaining Wall Brochure |

Visit www.firth.co.nz for further information on specific geotechnical and engineering design

---

This guide has been produced to illustrate the options available. It does not provide detailed design and construction information. Further information can be obtained from the listed reference material. Walls of these heights will require specific geotechnical and engineering design. Contact Firth or Humes as appropriate for details of designers experience in the design of these types of walls.
### HIGH RETAINING WALL GUIDE

#### KEYSTONE® COMPAC IV WITH GEOGRIDS

**Description**
Keystone® Compac IV facing. Geogrid length typically height of wall. Walls can be built near vertical or two battered setback options of 8.8° and 4.4° can be built higher using geogrid soil reinforcement.

**Access Requirements**
Require access for excavation and compaction equipment. Compac IV elements arrive on a pallet but can be manhandled into place.

**Weight Of Unit (Approximate)**
35 - 45kg

**Excavation Required**
The length of the geogrids are typically similar to the height of the wall. The width of the excavation is therefore typically the height of the wall plus what ever distance is required to ensure stability of the exposed excavated face.

**Reference Material**
Visit www.firth.co.nz for:
- Keystone® Compac IV Brochure
- Keystone® Construction Manual
- Keystone® Design Manual Keywall Software Package

#### FIRTH MASONRY

**Description**
For walls greater than 2.5m high, 240mm wide blocks will be required. The components of the systems are essentially the same as for smaller walls however the amount of reinforcing and dimensions of footings are larger.

**Access Requirements**
Require access for excavation and compaction equipment. Masonry block arrive on a pallet but can be manhandled into place. Will need access for concrete truck and pump to place concrete and fill blocks.

**Weight Of Unit (Approximate)**
240mm wide block - [2516] 19kg

**Excavation Required**
With the footing extending in front of the wall the excavation depth is typically the wall thickness (200mm) plus the width of drainage materials (300mm). Then what ever distance is required to ensure stability of the exposed excavated face. When the footing extends to the rear of the wall, the excavation required is increased by the footing width.

**Reference Material**
Visit www.firth.co.nz for:
- Cantilevered Masonry Retaining Walls
- Firth Masonry Brochure

#### HUMES ANCHORBLOC™

**Description**
The blocks are 1.2m wide and 1m high. The hollow centre reduces the weight of the unit. The void being gravel filled after erection. The system is available in half height units and corner units. The face can be modified to achieve various decorative finishes, the most common being an exposed aggregate finish. The units are designed to accommodate geogrid.

**Access Requirements**
Require access for excavation and compaction equipment, and will need access to allow delivery of the units.

**Weight Of Unit (Approximate)**
The 1.5 tonne units can be easily lifted by standard excavation equipment.

**Excavation Required**
The depth of the units is 900mm, so excavation is required to accommodate the units, drainage pipes, the length of any geogrid (when required) and what ever distance is required to ensure stability of the exposed excavated face.

**Reference Material**
Visit www.humes.co.nz for:
- Humes Concrete Retaining Wall Brochure

#### SOIL NAILS & GROUND ANCHOR SYSTEMS

**Description**
Soil nails are used to form a stabilised block that is large enough to form a stable gravity structure. They are 75 – 150mm in diameter spaced at 1.0 - 1.5m vertically and horizontally. Facings include mesh, sprayed concrete, keystone and precast panels. Soil and rock anchors are stressed and used to tie back retaining wall structures. These are typically 150 – 250mm in diameter and use high strength pre-stressing strand or bar. Durability and routine monitoring need to be considered given their highly loaded condition.

**Access Requirements**
The plant to install soil nails and rock anchors can range from hand held rope access tooling to specialised 12T tracked plant. The solution needs to be designed to suit the access requirements. Generally soil nails are shorter than rock anchors and can be installed with smaller plant and so suit limited access situations.

**Excavation Required**
Soil nails and anchors are drilled into the retained soil mass either from the existing ground surface profile or as the final retained face is exposed, no excavation is required to provide stabilisation. Where the retained face is on or close to the boundary agreement of the adjacent property owner/easement will be required as the elements are likely to project beyond the boundary.

**SOLDIER PILE WALL**
- Spaced embedded structural elements and infill panels (timber, concrete or steel).
- Wide range of plant from excavator and pendulum borer for timber pole walls to hydraulic drilling rigs and handling crane for concrete bored pile options.
- Limited excavation/backfill of retained material. 100% of the net wall volume.
- Ground unsupported prior to the placement of panels.
- No groundwater control.
- Different material options can be selected to suit conditions and design life/durability requirements.

**CONTINUOUS BORED PILE WALL**
- Series of bored pile installed at close spacing with concrete arches between.
- 30 – 70T hydraulic drilling rigs and handling crane used to install bored piles.
- Limited excavation/backfill of retained material. 100% of the net wall volume.
- Ground unsupported prior to sprayed concrete infill.
- No groundwater control.
- Conventional concrete in the ground design. Drainage cavity and internal wall for water seepage.

**SHEET PILE WALL**
- Clutched sheet piles driven to depth.
- 50 – 70T cranes are required to pitch and drive sheet piles using vibro or impact hammers.
- No excavation/backfill of retained material. 100% of the net wall volume.
- Ground unsupported prior to sprayed concrete infill.
- No groundwater control.
- Re-useable sheet piles well suited to temporary works. Corrosion to be considered for permanent works.

**SOIL MIX / SLURRY WALL**
- Steel or precast concrete elements in a 0.6 – 1.0m wide soil mix/slurry wall.
- 40T excavators, 70T crane and grab or Soil-mixing rig used to install bored piles.
- Limited excavation/backfill of retained material. 120% of the net wall volume.
- Retained face is protected and supported all times.
- Groundwater seepage at cold joints between piles.
- Sacrificial steel and internal lining wall required for long-term water seepage.

**SECANT PILE WALL**
- A series of 0.6 – 1.5m dia. piles installed so that they overlap to form a wall.
- 50 – 70T hydraulic drilling rigs and handling crane used to excavate the panels. Support fluid mixing, conditioning and storage on site.
- Close to boundary possible with no excavation. Flexible wall layout means site area can be maximised.
- Access required for delivery of concrete and rebar cages delivery.
- No internal lining wall necessary.

**DIAPHRAGM WALL**
- A series of interlocking reinforced concrete panels to form a 0.6 – 1.2m thick wall.
- 100T crane and grab used to excavate the panels. Support fluid mixing, conditioning and storage on site.
- Close to boundary possible with no excavation. Ideally straight walls as layout governed by grab length.
- Flexible wall layout means site area can be maximised.
- Access required for delivery of concrete and rebar cages delivery.

Visit www.brianperrycivil.co.nz for: Foundations & Retaining Walls Catalogue

This guide has been produced to illustrate the options available. It does not provide detailed design and construction information. Further information can be obtained from the listed reference material. Walls of these heights will require specific geotechnical and engineering design. Contact Firth, Humes, or Brian Perry Civil as appropriate for details of designers experience in the design of these types of walls.
I need a building consent, what do I need to do?
You will need to contact an engineer. Depending upon the complexity of the situation, the engineer likely needs to know:

- The engineering properties of the ground, this will probably necessitate some shallow geotechnical investigations.
- A topographical survey to determine the probable heights of retaining walls and slopes behind and in front of the proposed retaining walls.
- The location of any roads and structures relative to the proposed retaining wall.
- The desired appearance of the wall, i.e. is it desired to be vertical, what are the preferences regarding colour and texture.
- Is the retaining wall on a boundary? Do consents exist to have items such as soil anchors that extend under the neighbouring property? If no consents exist the whole wall and excavation to construct the wall must be within the boundary.
- Do buried pipes or underground services exist which need protection?

What can I expect from the retaining wall design engineer?
For most residential retaining walls designs, the following would be provided which can be used to obtain quotes for the construction of the wall and/or apply for a building consent.

- Drawings showing the location of the wall and typical cross sections.
- A statement on the construction methodology.
- Statements on the material properties of the components of the wall.
- Testing requirements (when applicable).
- Construction inspection requirements for the engineer.
- A producer statement – Design [referred to as a PS1].
- A memorandum from Licensed Building Practitioner certificate of design work. This form is required for a building consent application.
I have received a payout from EQC or my insurance company as compensation for damage to retaining walls. Do I really need to spend the money on the walls?

It is important that retaining walls are repaired or reconstructed. Failure to do so may invalidate future insurance claims. The Householders’ Guide to EQCover states “EQC can refuse to pay a claim or part of a claim if an earlier claim on the property has been paid but the property has not been repaired or replaced and this has caused or help cause the damage”. As many insurance policies for retaining walls are based upon indemnity value, it may mean that the property owner will have to contribute financially to the rebuilding of the wall.

What life expectancy should I expect from the wall?
To comply with the Building Code the wall should be serviceable for at least 50 years. Concrete products are ideally suited for this application as concrete in moist situations actually get stronger with age.

Do I need a barrier/hand rail at the top of the wall?
The rules on barriers can be found in section F4 of the NZ Building Code. Basically, barriers are required where people could fall greater than one metre, but this may not apply where the barrier is incompatible with the intended purpose. Where the wall is adjacent to a path or an area where people can gather it is likely that a barrier will be required. Where the drop is separated from access areas by a cultivated garden then a barrier may not be required. Check with your local Council.

Do I need to allow for drainage behind the wall?
Yes, definitely. The NZ Building Code requires a minimum diameter of 110mm for all drainage coils [clause E1]. This prevents a build up of water pressure behind the wall. The outlet of this pipe must be located to prevent erosion downstream.

What about underground services?
When conducting earthworks, care will need to taken to locate and protect underground services.

Are basement walls treated the same as retaining walls?
Basement walls typically both support the building above and retain the soil. Engineering input will always be required. Reinforced concrete masonry is ideally suited for this task. Waterproofing basement walls requires careful consideration. Some standard solutions are available in the NZ Standard NZS4229, and in the NZ Concrete Masonry Association's Masonry Manual. Refer to the Firth website [www.firth.co.nz] for a link to the Masonry Manual. These designs assume that the water table behind the wall is drawn down by drains at the base of the wall. For this to work the drains need to be able to discharge under gravity (ie without the use of pumps).

I’m a professional engineer, what resources are available to me to design a retaining wall system.
A link is provided on the Firth website to Keystone® retaining wall systems. The following manuals are available:

- Keystone® Construction Manual - this covers how to construct Keystone® walls, some typical details, and some generic designs.
- Keystone® Design Manual - this provides detailed information on the design of Keystone® systems and information on the KeyWall® design software.

Also available is the KeyWall® design software. For further details on this package email: firth.retainingwalls@firth.co.nz The software is suitable only for professional engineers who have experience in the design of retaining walls.

For high retaining walls that are embedded or anchored, Brian Perry Civil can provide design and methodology advice to facilitate the development of cost effective bespoke solutions.

Technical support is available for professional engineers wishing to design Keystone®, Masonry, embedded and anchoring retaining walls.
